

## PRESS RELEASE

# dreii01 presents the next generation of the Digital Insurance Engine

## **dreii01 Digital Insurance Engine grows into a modern software suite.**

dreii01 introduces the next generation of the Digital Insurance Engine. The software for underwriters and insurers has been enhanced with many important features, making case processing even faster and more efficient. The insurtech's Minimal Viable Product has become a powerful software package that includes all the functions needed for day-to-day business in one application while remaining simple and intuitive to use.

dreii01 introduces the next generation of the Digital Insurance Engine, where the entire value creation process of a TPA is covered by a single software. The application, which remains simple and intuitive to use despite the high complexity of business transactions, significantly simplifies and accelerates processes.

Highlights of the new version are the module for case-closing claims processing, an integrated document management system, and the further automation of business transactions, which, for example, enables desired rate adjustments to be made quickly and easily. All important documents are made available in the customer portal.

Partner management has also been expanded. Premiums and products can be individually configured and adjusted for each partner at any time.

The online closing module, the customer portal, and the partner portal can now be displayed in any language, thus supporting international sales.

dreii01 rounds off the new functions of the Next Generation with a new, modernized design.

The new functions are available immediately.
